Prerequisites

Before starting, ensure you have completed all the steps in `Setup`. You should have

1. Installed all necessary dependencies
2. Dockerized your repo/environment
3. Have an Zed open, connected to your dockerized environment with the agent ready

---

Claim a Starfleet task

First claim a task in Starfleet which will determine what kind of prompt/project you have to come up with

---

Start the session

Run

```
None
cd /testbed/{repo_name}
```

Confirm model + submit initial prompt

- Confirm the model is ***grok-code-fast-1*.**
- Start with your initial prompt following the project guidelines in Overview

---

Working with the Agent

Interaction Guidelines

- **Agent Only.** Do not manually edit files.
- **Interact naturally** as you would with a real coding assistant.
- **Test** as you go and provide feedback to the agent.

- **Guide the agent** when it gets stuck, but avoid spoon-feeding solutions.

Keep prompts concise, human-like, and iterative.

Session Requirements

- **Be natural**
- **Maximum duration: 2 hours of meaningful interaction**
- Approximately **10 meaningful turns** (eg. “continue” is not considered as a turn). If you can’t reach 10 turns, especially when refactoring code, that’s fine.
- **Keep context in one conversation**
    - if you get a “prompt is too long” error, or it is hanging, please end the conversation and submit the task
- **Cover the full development lifecycle:** initial setup, feature implementation, debugging, refinement
- **Test your application** throughout the session (you can use commands to start services)

End the Session

Once the session is complete:

1. **Record a 3-minute demo** of the final project/feature/refactor. A voice-over is recommended. When working on an existing codebase, showcasing a before and after comparison of what the model has implemented helps reviewers to quickly evaluate the task’s scope and impact.
2. **Type “q” into the zed-eval CLI tool to start saving the images and messages from your session. You should get an output.json file that looks like this:**
    - **Please make sure to keep your container open for 10 minutes after your last turn! This can be while you are uploading your images.**
    - Note: The script will save output.json in `images/<run_id>/`
    - Please do not manually create or modify this file

-
```
{
    "version": "1",
    "task_id": "test-6",
    "tutor_name": "QuitmanWakeley",
    "project_id": "test",
    "base_image": {
        "image_tag": "zed-eval-session:QuitmanWakeley_test_test-6_08e94557_base",
        "image_size_mb": "1180",
        "registry_url": "registry.nova.teachx.ai/zed-evals/zed-eval-session:QuitmanWakeley_test_test-6_08e94557_base"
    },
    "turns": [
        {
            "timestamp": "2026-01-15T08:24:05.060413",
            "turn_number": 1,
            "prompt": "delete authors.md for me please",
            "session_id": "019bc1d3-9699-7091-8081-fb49e818cf02",
            "commit": {
                "image_tag": "zed-eval-session:QuitmanWakeley_test_test-6_08e94557_1",
                "image_size_mb": "1408",
                "registry_url": "registry.nova.teachx.ai/zed-evals/zed-eval-session:QuitmanWakeley_test_test-6_08e94557_1"
            }
        }
    ],
    "dockerfile": "FROM node:22.21.1-bookworm\n\nRUN apt-get update && apt-get install -y \\\n  python3 \\\n  python3-venv \\\n  python3-pip \\\n  git \\\n  bu
}
```

3. **Create a folder** in the shared Google Drive folder:
    - Folder name: your Task ID
    - Sharing: "x.ai – Anyone with the link can view"
4. **Upload the demo recording**
    - File naming format: `SWEArena_[ProjectName]_[Date]_[TutorName].mp4`
5. **Complete the task submission** with:
    - The Google Drive recording link https://drive.google.com/drive/u/0/folders/1iH8VtliD4EXmnMhIoa3k1QKvAKASMlMN
    - Uploading output.json
    - Uploading session.tar.gz **IF AND ONLY IF THE TAR UPLOAD FAILED**
